

DONATE COAL TO FIGHT COLD

2020 WINTER AMAL PROJECT FOR MASJID

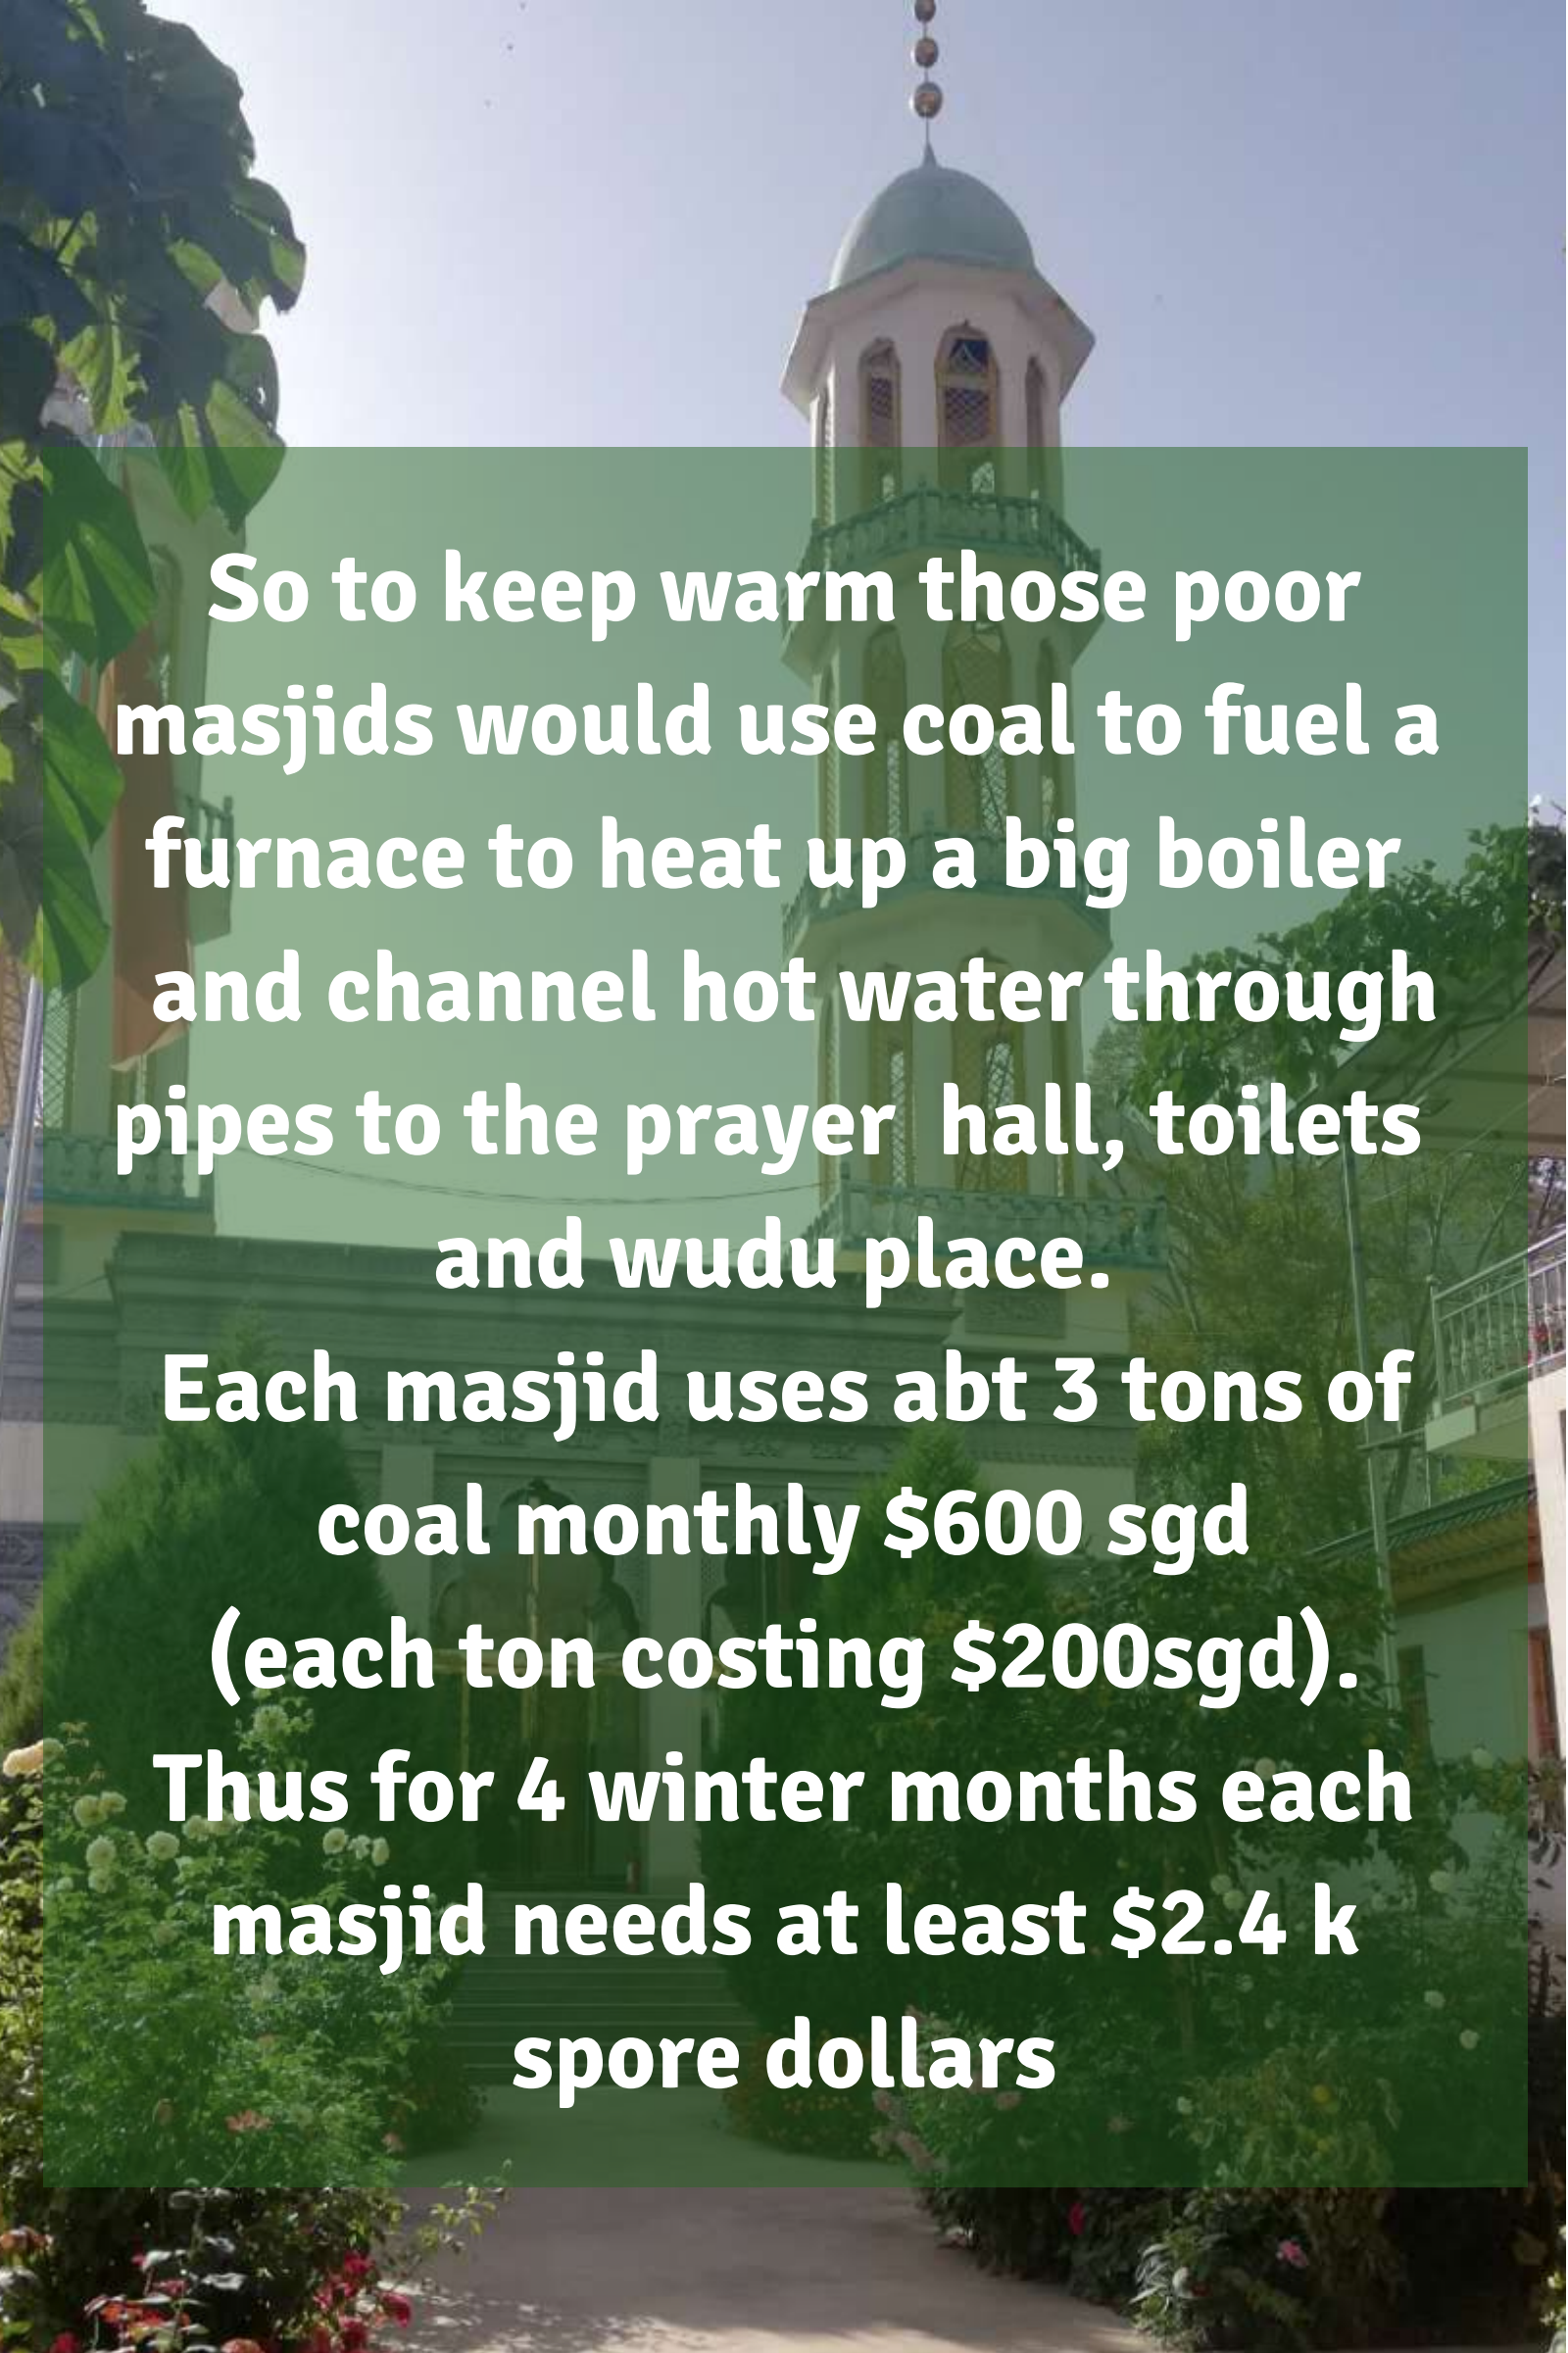

**There are more than 20
poor masjids in the rural
areas of Qinghai, Gansu
Provinces n Linxia County
which are too poor to
afford installing any kind
of electrical heating
system that incur paying
utilities bill!**

In these northwestern China regions, during the 4 winter months from November to February it is freezing cold..temperature can drop to below 20 degrees celcius!

So to keep warm those poor masjids would use coal to fuel a furnace to heat up a big boiler and channel hot water through pipes to the prayer hall, toilets and wudu place.

Each masjid uses abt 3 tons of coal monthly \$600 sgd (each ton costing \$200sgd).

Thus for 4 winter months each masjid needs at least \$2.4 k spore dollars

XINING - Continuous snow has swept Qinghai province in Northwest China since the start of November, accumulating record high precipitation in the region's 57 years of history of meteorological records.

Snow accumulation between Nov 2 and 7 has reached 18 cm on the ground in Dulan County, Haixi Mongolian Tibet Autonomous Prefecture, where the height above mean sea level averages 3,180 meters.

The Qinghai-Tibet Plateau, known as the "roof of the world," is an important region to monitor climate changes with the weather and the glaciers as indicators.

"Twenty-seven counties in Qinghai have seen the November snow set historical records. The provincial capital of Xining has seen precipitation reach 25.8 mm, also a record high," said Ma Zhanliang, senior engineer with the provincial climate center.

He said the big snowfall was triggered by the collision of southward polar cold air and warm air from southern China.

The provincial meteorological station warned that the severe snowstorms and continuous cold weather would cause difficulties in road traffic, transport, agriculture and animal husbandry.
